

RIVO MULTITRADE OPTICAL SYSTEMS

Cable tray air defense sealing

Overview

AF BAGS are intumescent and ablative fireproof pillows certified under EN 1366-3 for sealing up to EI 240 of cable tray penetrations.

Key Takeaways

Cable tray air defense sealing involves using fireproof pillows, pressure-exerting sealants, and modular frames to create airtight, fire-resistant, and weatherproof barriers around cable tray penetrations. Fireproof Sealing Solutions

Intumescent pillows like AF BAGS are designed to seal cable tray penetrations in walls, floors, and sandwich panels. They expand under heat to prevent fire and smoke passage, providing protection up to EI 240 according to EN 1366-3 standards. AF BAGS are suitable for cables up to 21 mm in diameter and can be installed in thin structures without additional framing. They are repositionable, non-toxic, and facilitate maintenance or modification of cable systems. Pressure-exerting sealants, such as Pyroplex, expand multi-directionally when exposed to high temperatures, sealing around single or bunched cables and small pipes. These sealants are halogen-free, odorless, and provide fire resistance up to 240 minutes. They are ideal for internal applications and can be combined with coatings for enhanced protection.

Modular and Weatherproof Systems

Modular firestop systems like Hilti's cable transit frames create water-, smoke-, and gas-tight barriers for industrial and offshore projects. These systems are designed for easy installation around multiple cables and can be adapted to different penetration sizes. Weatherstop frames from CSD are suitable for outdoor environments, using corrosion-resistant steel frames with water-resistant pads and silicone-based sealants. They provide a weathertight seal for cable trays, conduits, and bus ducts, allowing easy maintenance without additional parts. These systems are NEMA-rated up to 4X and are non-toxic, halogen-free, and suitable for hazardous or wet conditions.

Installation Considerations

- Measure the cable tray dimensions to select the appropriate size and number of sealing units or pillows.
- Ensure surfaces are clean and dry before applying sealants or installing frames.
- Follow manufacturer guidelines for sealing depth, fire rating, and compatibility with wall or floor materials.
- Allow for maintenance access, especially when using repositionable pillows or modular frames. By combining these solutions, cable tray penetrations can be effectively sealed against fire, smoke, air, and water, ensuring compliance with safety standards and maintaining system integrity in industrial, commercial, and offshore environments.
