

Commonly used optical splitters in PON systems include

Overview

Optical Splitters: Split Ratios, Splitting Architectures & PON Network. This guide focuses on two critical aspects of optical splitters that define FTTH.

Key Takeaways

The most commonly used optical splitters in PON are FBT (Fused Biconical Taper) and PLC (Planar Lightwave Circuit) splitters, typically deployed in split ratios ranging from 1x2 to 1x64 depending on network requirements.

1. FBT Splitters:

- Fused Biconical Taper (FBT) splitters are low-cost and ideal for small split ratios such as 1x2 or 1x4.
- They are suitable for short-distance deployments and smaller subscriber clusters due to their simplicity and cost-effectiveness.

2. PLC Splitters:

- Planar Lightwave Circuit (PLC) splitters provide highly uniform signal distribution and are preferred for larger split ratios like 1x32 or 1x64.

- PLC splitters are more reliable for high-density networks and long-distance deployments, offering consistent performance across all outputs.

Common Split Ratios

- Standard split ratios in PON networks include 1x2, 1x4, 1x8, 1x16, 1x32, and 1x64.

- Odd ratios like 1x3 or 1x5 are occasionally used for specific network designs .
- The choice of split ratio affects bandwidth allocation per subscriber and overall network scalability .

Deployment Architectures

1. Centralized Splitting:

- A single-stage splitter is placed between the OLT and ONTs, typically in a central office or cabinet.
 - Advantages include easier maintenance, reconfigurable customer assignments via jumpers, and suitability for high-density urban areas .
- ##### 2. Cascaded (Distributed) Splitting:

- Multiple splitters are connected in series, often deployed in closures or pedestals closer to subscriber clusters.
- This architecture reduces fiber count from the OLT, saves duct space, and allows flexible network expansion, though customer assignments are generally fixed once deployed .

Summary

In modern PON networks, FBT splitters are commonly used for small-scale splits, while PLC splitters dominate large-scale deployments due to their uniformity and reliability. Split ratios from 1x2 to 1x64 are standard, and deployment can follow centralized or cascaded architectures depending on network density, cost considerations, and scalability requirements . These splitters are essential for enabling cost-efficient, passive, and scalable FTTH networks.

Article Content

Optical Splitters: Split Ratios, Splitting Architectures & PON Network ...

This guide focuses on two critical aspects of optical splitters that define FTTH performance: split ratios (how signals

Introduction to Passive Optical Network Splitter Architectures

A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations

Optical Splitters are used in PON (Passive Optical Network

(PON) is a point-to-multi-point fiber to the premise network architecture. This type of network uses unpowered Optical Splitters along

Introduction to Passive Optical Network Splitter Architectures

This configuration is often used in conjunction with standalone splitters, cascaded splitters, or optical taps. Real-World Example: In

What Is Passive Optical Networking (PON)?

In a PON network, a device called an optical line terminal (OLT) is placed at the head end of the network. A single fiber-optic cable

Fiber Optic Splitters for PON Networks: 2025 Guide

In this guide, you'll learn how fiber splitters function in PON networks, the difference between PLC and FBT types, and

Understanding PON Fiber Splitters

PON fiber splitters are passive devices that do not require external power sources. They utilize optical waveguide

The FOA Reference For Fiber Optics

A PON system utilizes a passive optical splitter that takes one input and splits it to "broadcast" signals downstream to many users.

PON Architecture and Components

Passive optical networking (PON) is a full duplex technology that uses inexpensive optical splitters to divide a single

Passive Optical Network (PON) design and managing 101

What is PON design? A passive optical network is a fiber-based network architecture that uses unpowered (passive)

Deciphering the Passive Optical Splitter in PON Network

In the rapidly evolving landscape of optical networks, understanding the intricacies of Passive Optical Network (PON)

Passive optical network

Passive optical network A fiber optic cable assembly with SC APC connectors, as commonly used to link optical network terminals to

The FOA Reference For Fiber Optics

Testing Fiber Optic Couplers, Splitters Or Other Passive Devices A passive device used to split or combine signals on fiber optics

Passive Optical Network Splitters: How PON Splitters Work

Passive Optical Network splitters distribute fibre signals in PON networks. Learn about split ratios, optical loss and reliable design.

PON for Dummies: Understanding Passive Optical Networks

A passive optical network (PON) is a point-to-multipoint fiber network architecture that uses optical splitters to deliver high-bandwidth

Passive Optical Network (PON)

A passive optical network (PON) is a fiber-optic network utilizing a point-to-multipoint topology and optical splitters to deliver data

The FOA Reference For Fiber Optics

A passive optical LAN based on PON FTTH components simple adds a passive splitter to the cable plant architecture (which can be

Passive Optical Networks (PON) | Telos

The primary elements of a PON system are the OLT, ONT, fiber optic cables, and optical splitters. The OLT serves as the main hub
