

Current limiting in household user distribution boxes

Overview

Utilize switchboards throughout the distribution system where feeders are 1200A or larger. Devices must be front accessible and must be completely isolated between sections by vertical steel barriers. Switchboards should have hinged fronts to allow safer maintenance access. A power distribution box, sometimes referred to as a distribution board or panel, is an enclosure that houses electrical circuit breakers, fuses, and busbars. Its primary function is to divide an electrical power feed into subsidiary circuits while providing a protective fuse or circuit breaker for. Electronic circuits called current limiting circuits restrict the flow of current through specific components or loads. They safeguard vulnerable components from harm caused by too much current and support the circuit in working safely and dependably. Some of the requirements and ratings include: voltage, continuous current, wire range (load and line side). From January 2016, The IET Wiring Regulations required that consumer units in domestic (household) premises were manufactured from non-combustible material.
