

## Detailed Budget for Aerial Optical Cable Construction

### Overview

Budgeting a Fiber Optic Network Project | NFM Consulting Fiber optic network projects for industrial and oil and gas applications typically cost \$15,000-50.

### Key Takeaways

Aerial fiber optic cable construction typically costs \$5-\$14 per foot (\$15,000-\$33,000 per mile), with major expenses including cable, labor, pole make-ready, hardware, and permitting. Cost Components

#### 1. Fiber Cable and Materials

- Single-mode outdoor fiber cable: \$0.50-\$3.00 per foot depending on fiber count (12-144 fibers) and construction type (loose-tube or armored) for aerial use .
- Patch panels and connectors: \$300-\$1,000 per distribution panel; \$10-\$25 per connector .

• Hardware for aerial installation: Strand, lashing, and mounting hardware are included in installation costs but may require additional poles if new installations are needed (\$800-\$2,000 per pole, typically every 250-300 feet), . 2. Labor and Installation

- Aerial installation on existing poles: \$3,000-\$8,000 per mile, including cable lashing and hardware .

- Labor per foot: \$4-\$7 for firms with their own poles; \$6-\$14 per foot if renting poles or requiring make-ready work .

- Make-ready costs: Preparing poles for new attachments can add \$800-\$4,500 per pole, depending on pole condition and utility requirements .

- Labor typically accounts for 60-80% of total deployment costs . 3. Permitting and Regulatory Fees

- Permits, utility coordination, and inspections can vary by region and may add several thousand dollars to the project budget. Delays in permitting can impact overall costs and timelines . 4. Testing and Splicing

- Fiber splicing, testing, and certification are essential for reliable operation. Costs vary by project size but are generally included in labor or subcontractor fees. 5. Contingency

- A 15-20% contingency is recommended to cover unforeseen conditions such as terrain challenges, additional make-ready work, or unexpected labor requirements .

Example Budget Calculation (Per Mile)

| Component                   | Estimated Cost (USD)       |
|-----------------------------|----------------------------|
| Fiber cable (12-144 fibers) | \$2,640-\$15,840           |
| Patch panels & connectors   | \$1,000-\$3,000            |
| Aerial installation labor   | \$3,000-\$8,000            |
| Pole make-ready (if needed) | \$3,500-\$7,000 per pole   |
| Permitting & miscellaneous  | \$1,000-\$3,000            |
| Subtotal                    | \$15,420-\$33,106          |
| Contingency (15-20%)        | \$2,313-\$6,621            |
| Total Estimated Cost        | \$17,733-\$39,727 per mile |

Key Considerations

- Pole ownership: Using existing poles reduces costs; renting or replacing poles increases expenses.

- Terrain and environment: Rural areas with clear corridors are cheaper; dense urban or suburban areas with aging infrastructure increase make-ready costs.

- Project scale: Longer runs increase cable, labor, and permitting costs proportionally.

- Long-term value: Despite higher upfront costs, fiber offers a 25-30 year lifespan with low recurring costs, making it cost-effective over time . This budget framework provides a practical guide for planning aerial fiber optic construction, allowing for adjustments based on local labor rates, pole conditions, and project-specific requirements.
