

Security-grade co-packaged optical 1G selection guide

Overview

Ultimate Guide to 1G SFP Module Selection Learn how to choose the right 1G SFP module for your network. Our guide covers compatibility, distance, Co-Packag.

Key Takeaways

Selecting security-grade 1G co-packaged optics requires evaluating interface type, fiber compatibility, wavelength, environmental resilience, and integration with CPO switch architectures. Understanding Co-Packaged Optics (CPO)

Co-packaged optics (CPO) relocates the optical engine directly onto the switch ASIC package, minimizing electrical path length, reducing power consumption, and increasing bandwidth density compared to conventional pluggable optics . For 1G applications, this approach ensures low-latency, high-reliability links suitable for secure or high-performance networks. The optical engine converts electrical signals to light, with fiber connections leaving the switch box, simplifying the signal path and improving energy efficiency .

Key Selection Criteria for 1G CPO Modules

- Interface and Modulation
- Ensure the module supports 1G SFP standards (Gigabit Ethernet) and the required modulation type (typically NRZ for 1G links), .
- Verify compatibility with the switch's electrical interface and CPO assembly specifications

- Fiber Type and Distance
- Choose between single-mode (SMF) or multi-mode fiber (MMF) depending on link distance and network topology.
- Consider the maximum transmission distance; 1G SFPs can range from a few meters (MMF) to tens of kilometers (SMF), .
- Wavelength
- Standard 1G SFP wavelengths include 850 nm for MMF and 1310 nm or 1550 nm for SMF.
- Ensure the wavelength aligns with existing network infrastructure and security requirements .
- Environmental and Security Considerations
- For security-grade deployments, select modules with enhanced temperature tolerance, EMI shielding, and tamper-resistant packaging.
- Modules should comply with relevant network security standards and support monitoring for link integrity and optical power anomalies .
- Compatibility and Interoperability
- Confirm the module is compatible with the CPO switch platform and any external light sources (ELS) if used .
- Vendor-neutral or certified modules reduce the risk of interoperability issues and ensure stable operation .
- Power and Thermal Management
- CPO modules reduce DSP requirements, but verify power consumption and thermal dissipation to maintain reliability in dense switch environments .

Practical Deployment Tips

- Integration with CPO Switches: Ensure the optical module aligns with the switch's co-packaged assembly, including fiber routing and connector type .
- Testing and Qualification: Perform pre-deployment testing for optical power, BER (bit error rate), and environmental stress to meet security-grade standards .
- Lifecycle and Maintenance: Consider replaceable laser modules or ELS for long-term maintainability without compromising security .

Summary

Selecting a security-grade 1G co-packaged optical module involves balancing performance, compatibility, and environmental resilience. Focus on interface type, fiber and wavelength, thermal and power characteristics, and compliance with security standards. Proper selection ensures reliable, low-latency, and secure network links suitable for modern datacenter or enterprise environments .
