

Which devices use multimode fiber

Overview

Multimode Fiber Types: OM1 vs OM2 vs OM3 vs OM4 vs OM5 Multimode fiber is a common choice to achieve 10 Gbit/s speed over distances required by LAN enterpr.

Key Takeaways

Multimode fiber is commonly used in networking devices, data center equipment, and short-distance communication systems within buildings or campuses. Networking and Data Center Equipment

Multimode fiber (MMF) is widely used in switches, routers, and network interface cards (NICs) that support high-speed Ethernet connections, typically ranging from 1G to 100G depending on the fiber type (OM1-OM5) and distance requirements . It is especially common in enterprise networks, campus networks, and modern data centers, where short-distance, high-bandwidth connections are needed . MMF pairs naturally with VCSEL-based transceivers, which are cost-effective and support high-speed applications .

Fiber-Optic Transceivers

Devices such as SFP, SFP+, QSFP, and QSFP28 modules often use multimode fiber for short-range connections. These transceivers convert electrical signals into optical signals and are compatible with OM3, OM4, and OM5 fibers for 10G, 25G, 40G, and 100G Ethernet links . Older transceivers may still use OM1 or OM2 fibers for 1G or 10G Ethernet over shorter distances.

Specialized Instruments

Multimode fiber is also used in laboratory and industrial equipment, including fiber optic spectrometers, light sources, and sampling accessories, where multiple light modes are advantageous . Additionally, MMF can carry high optical power for applications like laser welding or other precision optical systems.

Typical Applications

- In-building backbone networks connecting telecommunications rooms and equipment closets .
- Campus networks linking multiple buildings over short distances.
- Data centers for high-speed server-to-switch or switch-to-switch connections.
- Fiber-to-the-desk or fiber-to-the-zone deployments, bringing fiber closer to end users .

Summary

Devices that use multimode fiber include network switches, routers, NICs, optical transceivers (SFP/SFP+/QSFP), servers, and specialized optical instruments. MMF is ideal for short- to medium-distance, high-bandwidth applications, leveraging cost-effective light sources like LEDs and VCSELs, and is commonly deployed in enterprise, campus, and data center environments .
