

Which should I learn first PLC or relay protection

Overview

Let's understand the difference: □□ Relay Logic System A relay-based system uses physical relays, timers, and contactors for control operations. How Does Relay Logic Work?

Relay. Many new and retrofitted control panels employ components such as PLCs and even industrial PCs (IPCs) and programmable automation controllers (PACs) for advanced connectivity and control. PLC is programmed to perform a wide range of tasks, such as controlling motors, monitoring sensors, and communicating with other devices. The global PLC market is growing, and by 2026, the market size should amount to over 15. At its core, a relay is an electrically operated switch. □

Advantages: • Simple for small applications • Low initial cost • Easy to understand basic circuits □ Limitations: • Large wiring complexity • Difficult.
